What is FiveM?

FiveM is a multiplayer modification framework for Grand Theft Auto V. It allows players to join custom servers with unique game modes, rules, and mods — such as roleplay (RP), racing, zombies, drifting, or freeroam.

Unlike GTA Online, where Rockstar controls everything, FiveM servers are community-hosted and often feature custom cars, maps, jobs, police systems, and economy mods. It's the backbone of popular GTA RP servers like NoPixel, Eclipse RP, and thousands more.

How Does FiveM Work?
FiveM doesn't change your GTA V files. It runs in a separate environment, so it's safe to use and doesn't risk a Rockstar Games ban — as long as you don't cheat in GTA Online. You do need a legal copy of GTA V (from Steam, Epic Games, or Rockstar Launcher) to use it.

Minimum Requirements to Run FiveM:
A legal copy of GTA V

At least 8 GB RAM (16 GB recommended for smoother gameplay)

A mid-range GPU (GTX 1050 Ti or better)

Stable internet connection

Windows 10 or 11 (64-bit)

How to Install and Play FiveM:
Download FiveM:
Visit fivem.net and download the latest client.

Run Installer:
Install it on the same drive where GTA V is installed.

Launch FiveM:
Log in with your Cfx.re account. You'll now see the server browser.

Want to Create Your Own FiveM Server?
If you're interested in running your own FiveM server (public or private), it's completely free.

Here's a quick overview:

Download the server artifacts from FiveM's official site.

Generate a license key from keymaster.fivem.net.

Configure your server.cfg file with basic settings.

Add custom resources, jobs, maps, and scripts.

Open port 30120 on your router to make it public.

You can build your server using ESX, QBCore, or other frameworks depending on your needs.
